Re: **Tank and Product Line Removal Report and Request for No Further Action**  
76 Service Station Number 6424  
5345 Hazel Avenue  
Fair Oaks, California  
Delta Project C106424

Dear Mr. Marcus:

This report presents the results of soil sampling performed during demolition activities at the site reference above. In addition, this report requests "No Further Action" be granted for the site. The site is located at 5345 Hazel Avenue on the southwest corner of the intersection of Madison Avenue and Hazel Avenue in Fair Oaks, California. A site plan is included as Figure 1. Site demolition activities included the removal of three underground storage tanks (USTs), five fuel dispensers, the associated product piping, old product lines remaining in the subsurface of the site from past use, a storage building, and a cashier's kiosk. The majority of the demolition activities were performed by W.A. Craig, Inc. (W.A. Craig) between January and April 2005, with environmental services performed by Delta Environmental Consultants, Inc. (Delta) on behalf of ConocoPhillips Company (ConocoPhillips).

## **BACKGROUND**

The site is located on the southwest corner of Hazel Avenue and Madison Avenue in Fair Oaks, California (Figure 1) and was an operating 76 service station up until the end of 2004, when the ConocoPhillips optioned to close the station and completely remove all facilities from the site. Underground and above ground facilities that were to be removed included a storage building, a cashier kiosk, five dispenser islands, and three 12,000 gallon fuel USTs (diesel, unleaded and super unleaded). Figure 1 presents the location of these facilities.

## **Summary of Previous Site Activities**

In August of 1986, the original USTs were replaced with three 12,000 gallon fiberglass coated steel USTs. During the UST replacement activities, approximately 400 cubic yards of impacted soil were over-excavated from UST pit. Between 1987 and 1992, monitoring wells MW-A through MW-C, soil boring (B-8), twelve groundwater monitoring wells (MW-1 through MW-12) and four VE wells (VW-1 through VW-4) were installed.

A member of:

In June of 1991, an interim groundwater remediation system was initiated, which pumped groundwater through an oil/water separator, through an air stripper for treatment and then discharged the treated groundwater to the sanitary sewer. The system treated and discharged 253,437 gallons of water from June 1991 through December 1992. In February of 1992, a vapor extraction (VE) test was performed and it was determined that VE was a feasible remedial option. In May of 1993, product piping and dispensers were replaced and at the same time VE piping for future use was installed. In 1995, a VE system was installed and started. In November of 1995, two additional monitoring wells (MW-13 and MW-14) and 1 soil boring (B-15) were installed. During this time, two monitoring wells (MW-B and MW-C) were destroyed. In March of 1996, the VE system was shut down due to mechanical failure and was never restarted. In November of 1996, the groundwater remediation system was removed due to mechanical failure. In 1997, monitoring well MW-12 was destroyed. In 2000, monitoring wells MW-9 and MW-13 were destroyed and the quarterly sampling program was discontinued after a request for site closure was submitted to the SCEMD. Since site closure was not granted by the SCEMD, in December of 2002, a semi-annual groundwater monitoring and sampling program was initiated at the site. From March 31 through April 11, 2003, Secor International Inc.(Secor) performed a dual phase extraction test at the site to determine whether this technology could help remediate the site. Based on Secor's results report dated June 4, 2003, the 12-day DPE test recovered only 65 pounds of TPHg. From this data it was determined that DPE was not necessary at this since the data indicated that very little hydrocarbons could be removed from the subsurface soil. In an effort to assess the deep groundwater zone onsite, Gettler Ryan Inc. installed three deep wells (MW-15 through MW-17) on June 13, 16, and 18, 2003. Based on Gettler Ryan's "Additional Subsurface Delineation Report" dated August 13, 2003, the results from the installation of the three wells indicated that the deep groundwater zone had not been impacted. In 2004, correspondence between COP, Delta and the SCEMD indicated that all parties agreed that this site should be considered for closure pending results of this tank removal report.

## **SAMPLE PROCEDURES**

At the SCEMD's directions, soil samples were collected from the excavator's bucket for headspace analysis and laboratory sampling. For headspace analysis, a small amount of soil was placed into a Ziploc™ storage bag and allowed to equilibrate for a minimum of 5 minutes. The vapors in the bag were then measured with a photo-ionization detector (PID) and the readings were recorded. For collecting laboratory soil samples, at the direction of the SCEMD, a brass tube was driven by a rubber mallet into the soil of the excavator bucket. Once the brass tube was adequately packed with soil, the tube was sealed with Teflon sheeting and a tight fitting plastic cap and labeled. Samples were then placed on ice for transportation to Severn Trent Laboratories (STL) in Pleasanton, California, a California State-certified analytical laboratory. The samples were analyzed for total petroleum hydrocarbons as gasoline (TPHg), total petroleum hydrocarbons as diesel (TPHd), benzene, toluene, ethylbenzene, and total xylenes (BTEX), fuel oxygenates (methyl tert-butyl ether [MTBE], tert-butyl alcohol [TBA], di-isopropyl ether [DIPE], ethyl tert-butyl ether [ETBE], and tert-amyl methyl ether [TAME]), 1,2-dichloroethane (1,2-DCA), total lead, and total oil and grease (TOG) as appropriate depending on the sample location. Laboratory analytical results are summarized in Table 1 and the complete laboratory analytical reports and chain-of-custody documentation are included in Attachment A.

## **UST REMOVAL, SAMPLING, AND ANALYSES**

On February 9, 2005, Delta personnel observed the removal of three 12,000 gallon fiberglass coated steel USTs from the site under the supervision of Mr. Barry Marcus of the Sacramento County Environmental Management Department (SCEMD). Prior to the UST removals, WA Craig vented and iced-down the USTs with dry ice to insure that residual vapors were below acceptable limits. Once the tanks were deemed safe for removal and

approved for removal by the SCEMD, WA Craig removed the USTs and placed them on the surface for inspection. During their inspection, no visible holes were observed. The USTs were then approved for transport and disposal by the SCEMD and loaded onto flat bed trailers and hauled off site for proper disposal by ECI. The UST disposal manifests are included in Attachment B.

On February 9, 2005, Delta collected nine soil samples from beneath the ends and centers of the UST at a depth of approximately 17.5 feet below ground surface (bgs). Due to an elevated PID reading of 670 parts per million by volume (ppmv) from soil sample T3-N collected from the northeast corner of the UST cavity, approximately one excavator bucket full (~1 cubic yard) of soil was removed from this area down to 19 feet bgs and a second soil sample (T3-N-2) was collected. During the over-excavation/sampling activity, the bucket full of potentially impacted soil from the northeastern corner of the UST cavity was inadvertently placed atop of slough material within the UST cavity by the excavator. Since there was a concern of soil mixing, the SCEMD requested that a composite sample (COMP-1,2,3,4-T) be collected from the slough for disposal purposes. All of the soil samples were analyzed for BTEX, TPHg, TPHd, fuel oxygenates and 1,2-DCA. Since the western UST (T1) contained diesel fuel, the samples collected from beneath it were additionally analyzed for TPHd. Sample T3-N and COMP 1,2,3,4-T were also analyzed for total lead. The sample and over-excavation locations are shown on Figure 2.

With the exception of T3-N, all of the UST samples including the composite sample collected from the slough material inside of the UST cavity did not contain detectable concentrations of hydrocarbons at or above the laboratory reporting limits. Sample T3-N contained TPHg, ethylbenzene, total xylenes and lead at concentrations of 4,500 milligrams per kilogram (mg/kg), 7.3 mg/kg, 21 mg/kg and 6.2 mg/kg, respectively. Confirmation sample T3-N-2, collected at approximately 19 feet bgs (1.5 feet below the T3-N sample) did not contain any petroleum hydrocarbons at or above the laboratory reporting limits. Based on the T3-N-2 analytical results, it is believed that the elevated concentrations detected in T3-N were surficial and caused by residual petroleum hydrocarbons that may have drained back into the tank cavity when the product lines to the dispensers were disconnected. Table 1 presents the analytical results of the UST samples and the corresponding analytical laboratory methods.

Based on the analytical results from the UST soil samples, the UST tank cavity appeared not to be impacted. As a result, the UST cavity was cleared of the remaining slough material to a total depth of approximately 15 feet bgs. Approximately 100 cubic yards of slough material inside of the tank cavity was excavated and stockpiled for disposal. After the tank was cleared it was backfilled and compacted with Class AB fill material to the surface.

## **DISPENSER AND PRODUCT PIPING SAMPLING AND ANALYSES**

In early February 2005, prior to sampling activities under the dispenser islands and the product lines, WA Craig removed the dispenser islands and uncovered the product lines for SCEMD inspection. On February 9, 2005, Delta personnel met with SCEMD personnel on site to inspect the product lines and the soil beneath both the dispenser islands and the product lines. No visible leaks or damaged pipes were observed in the product lines. After the lines were inspected and cleared for removal by the SCEMD, WA Craig removed them. The product lines were subsequently hauled off site and disposed of by ECI under proper manifest. A copy of the disposal manifest is included in Attachment B.

At the SCEMD's direction, twelve soil samples were collected from approximately 2 feet beneath the dispenser islands, associated product piping, and vent lines. Samples were collected every 20 feet along the product lines and at joints and couplings unless otherwise directed by the SCEMD. The samples were analyzed for TPHg, BTEX, fuel oxygenates, and 1,2-DCA. In addition, samples P-5, located beneath the only diesel dispenser, and P-

1, P-3, P-4, and P-12, located beneath the diesel product piping, were analyzed for TPHd. Sample P-11 was also analyzed for total lead. The sample locations are shown on Figure 2.

Samples P-1, P-2, and P-4 contained MtBE at concentrations of 0.018 mg/kg, 0.026 mg/kg, and 0.0099 mg/kg, respectively. Samples P-1, P-2, and P-8 contained TBA at concentrations of 0.014 mg/kg, 0.10 mg/kg, and 0.018 mg/kg, respectively. Samples P-3, P-4, and P-5 contained concentrations of TPHd at 1.3 mg/kg, 1.1 mg/kg, and 3.0 mg/kg, respectively. The laboratory report indicated, however, that the TPHd quantity reported was of unknown hydrocarbons in the sample based on diesel. No other samples contained analytes above the laboratory reporting limits. Table 1 presents the analytical soil results and the corresponding analytical laboratory methods.

Based on the analytical results from the dispenser island and product line soil samples, the soil beneath both the dispensers and the product lines appeared not to be significantly impacted. As a result over-excavation activities beneath these facilities were not necessary.

## **OLD PRODUCT LINE SAMPLING AND ANALYSES**

Approximately twenty old product/vent lines were discovered in the subsurface across the site during demolition activities. These lines consisted of eight 2-inch diameter steel lines and twelve 2-inch diameter fiberglass lines. Samples were collected from beneath the old product lines on February 25, March 4, March 14, and April 5, 2005. With the exception of two product lines, the locations of the old product lines and the samples collected are shown on Figure 3. The two additional old product lines not on shown Figure 3 are presented on Figure 4. Based on a visual inspection of the old product lines, WA Craig removed and hauled off the old lines as construction debris. The old steel product lines were removed and sent to Schnitzer Steel Industries for recycling. Table 2 provides a description of the old product/vent lines.

The maximum soil contamination encountered during the removal of the old product lines was at the location of sample OPB-4(2FT) at approximately 2 feet bgs. Based on a PID reading of 1,604 ppmv, a 5 to 6 foot diameter area was over-excavated down to 4.5 feet bgs around OPB-4 (2FT), where a second PID reading of 111 ppmv was recorded at the 4.5 ft bgs level. At this location and depth a confirmation sample [OPB-4 (4.5FT)] was collected and submitted for laboratory analyses. Both samples OPB-4 (2FT) and OPB-4(4.5FT) were analyzed for TPHg, TPHd, BTEX, Oxygenates, and lead [OPB-4(2FT) only].

Laboratory analytical results for sample OPB-4(2FT) reported TPHg and TPHd concentrations at 1,900 mg/kg and 5,700 mg/kg, respectively. Benzene was not detected at or above the laboratory reporting limits. Toluene, ethylbenzene, xylene, and lead concentrations were reported at 10 mg/kg, 16 mg/kg, 120 mg/kg, respectively. Confirmation sample OPB-4(4.5FT) collected at a depth of approximately 4.5 feet bgs contained low level TPHg concentrations at 5.4 mg/kg and BTEX concentrations at 0.015 mg/kg, 0.013 mg/kg, 0.093 mg/kg and 0.44 mg/kg, respectively. TPHd was not detected in the sample collected at 4.5 feet bgs. Table 1 presents the analytical results and the corresponding analytical laboratory methods.

As a result of the over-excavation, an old concrete footing was encountered. In an effort to completely remove the footing, the excavation had to be expanded to an approximate 10 foot by 15 foot area down to 8 feet bgs. The excavation extents are shown on Figure 4.

## OLD FOOTING REMOVAL, SAMPLING, AND ANALYSES

On February 7, 2005, an old footing was found underlying an old product line near the middle dispenser (P-5) and was removed. A sample was collected from beneath the footing at approximately 6 feet bgs and from the sidewall of the footing location near the dispenser. On February 10, 2005, additional soil samples were collected from beneath the footing at approximately 12 feet bgs (P-14F) and 18 feet bgs (P14-18FT). The samples were analyzed for TPHg, TPHd, BTEX, fuel oxygenates, and 1,2-DCA. The samples were analyzed for TPHg, TPHd, BTEX, fuel oxygenates, 1,2-DCA, and total lead. Based on PID reading of 550 ppmv at 12 feet bgs, the footing was removed and the hole was over-excavated down to 18 feet bgs. At 18 feet bgs, the PID reading had decreased to <1 ppmv. A confirmation sample (P14-18FT) was then collected at this depth.

Sample P-14F contained TPHg, benzene, ethylbenzene, xylenes, MtBE and TPHd at 22 mg/kg, 0.053 mg/kg, 0.51, 0.067 mg/kg, 0.11 mg/kg and 3.7 mg/kg, respectively. P-14-18FT did not contain any analytes above the laboratory reporting limits.

During the process of over-excavating soil in order to obtain the samples beneath the footing, large cobbles were found extending to approximately eight feet west of the footing. It is believed that the cobbles may have been present due to a former septic leach pit. Therefore, at the direction of the SCEMD, an area of approximately 8 feet by 12 feet was over-excavated down to approximately 6 feet bgs where the cobbles ceased to exist. A confirmation sample was collected at the base of this excavation and analyzed for TPHg, TPHd, BTEX, fuel oxygenates, 1,2-DCA, lead and TOG. With the exception of MtBE, TBA and THPd, all other constituents were not detected at or above the laboratory reporting limits. Concentrations of MtBE, TBA and TPHd were reported at 0.026 mg/kg, 0.010 mg/kg and 1.3 mg/kg, respectively. Lead was reported at low levels (5.2 mg/kg) from the footing area from a previous collected sample (FOOTING). Table 1 presents the analytical results and the corresponding analytical laboratory methods.

In an effort to determine the lateral extent of the impact from the petroleum hydrocarbons beneath the footing, samples were collected approximately 10 feet south of the footing at approximately 12 feet bgs (SPH-12FT), 16 feet bgs (SPH-16FT), and 18.5 feet bgs (SPH-18.5FT) with the use of an excavator. Low levels of MtBE were detected in samples SPH-12FT and SPH-16FT at 0.084 mg/kg and 0.022 mg/kg, respectively. Low levels of TAME and TBA were also detected in sample SPH-12FT at 0.0061 mg/kg and 0.015 mg/kg, respectively. No analytes were detected in the sample SPH-18FT at or above the laboratory reporting limits. The analytical results from this area indicate that the majority of the impacted soil around the old footing was limited and that the majority of impacted soil had been removed during the removal of the footing and the over-excavation activity. Table 1 presents the analytical results and the corresponding analytical laboratory methods.

The over-excavated areas of the suspected leach pit, footing and confirmation footing test pit was backfilled and compacted with Class AB fill material. The over-excavation extents are shown on Figure 4.

## PLANTER AREA SAMPLING AND ANALYSES

On March 8, 2004, samples (PS-1 and PS-2) were collected beneath an old product line that was found in an old planter area in the southwest portion of the site. The upper one foot of soil beneath the top soil was found to be stained in this area. With a PID reading of 120 ppmv at the surface of the old product line in this area, the stained soil and product line was removed down to one foot bgs. At one foot bgs, the PID readings were nondetect.

Confirmation samples PS-1 and PS-2 were then collected at one foot beneath the old product line. The over-excavation extent and sample locations are shown on Figure 4. The samples were analyzed for TPHg, TPHd, BTEX compounds, fuel oxygenates, 1,2-DCA, and total lead. The laboratory analytical results did not report any of the analytes over the reporting limits, except for total lead at 4.2 mg/kg (PS-1) and 4.5 mg/kg (PS-2). Table 1 presents the analytical results and the corresponding analytical laboratory methods.

## **EXCAVATED /OVER EXCAVATED SOIL STOCKPILE SAMPLING, ANALYSES, AND DISPOSAL**

Through out the demolition activities at the site, ten composite soil samples were collected for disposal of the soil generated during excavation and over-excavation activities. Table 1 contains the analytical results of all of the stockpile composite samples. Table 3 presents the estimated volume of soil removed from the site for the over-excavated areas and then gives a total estimated removal of all excavated soil through April 13, 2005. All excavated soil was transported by Tim A. Manley Trucking, Inc. to Forward Incorporated Landfill located in Manteca, California, for disposal on February 14, February 24, February 25, March 11, March 16, April 13, and April 27, 2005. The non-hazardous waste manifests are included as Attachment B, except for the soil transported on April 27, 2005, since the manifests were unavailable at the time of reporting. Additionally, there still remains up to approximately 150 cubic yards of soil at the site that has been sampled and profiled (SP-21,22,23,24 and partially PL-SP-1,2,3,4) and is awaiting loading and hauling by WA Craig and Tim A. Manley Trucking, Inc. The non-hazardous waste manifests for the April 27, 2005 and final soil removal events will be provided once they are available.

## **SUMMARY/CONCLUSION**

The majority of the shallow petroleum impacted soil encountered during site demolition has been removed through over- excavation activities. Any remaining shallow impacted soil is considered to be very low in concentration and localized at the site. Based on the remaining low levels that exist in shallow soil at the site and historic depth of groundwater in this area, it is believed that these levels do not pose a significant threat to groundwater and will be completely remediated through natural attenuation. Based on the findings in this report; the extensive remediation performed at the site; overall declining groundwater petroleum hydrocarbon concentrations trends as indicated in the quarterly groundwater monitoring reports; and discussions with the SCEMD, Delta recommends that this site be considered for a "No Further Action" status.

## **REMARKS**

The recommendations contained in this report represent Delta's professional opinions based upon the currently available information and are arrived at in accordance with currently acceptable professional standards. This report is based upon a specific scope of work requested by the client. The contract between Delta and its client outlines the scope of work, and only those tasks specifically authorized by that contract or outlined in this report were performed. This report is intended only for the use of Delta's client and anyone else specifically listed on this report. Delta will not and cannot be liable for unauthorized reliance by any other third party. Other than as contained in this paragraph, Delta makes no express or implied warranty as to the contents of this report.

Should you have any questions or concerns regarding the information provided in this report, please do not hesitate to contact us at (916) 503-1262.

Sincerely,

**Analytical Methods:**  
 TPH-g/BTEX/MTBE/OXYS/1,2-DCA = EPA Method 8260B  
 TPH-d = EPA Method 8015M  
 Total Lead = EPA Method 6010B (Except in P-11; COMP-1,2,3,4-T; SP-1,2,7,8, and SP-5,6,3,4 by 6020)  
 TOG = EPA Method 1664A

**Notes:**  
 -- = Data not collected or otherwise unavailable  
 ft bgs = feet below ground surface  
 mg/Kg = milligrams per kilogram  
 TPH-g = Total petroleum hydrocarbons as gasoline; reported as GRO (C6-C12)  
 (Gasoline range organics with carbon chains 6 to 12 carbons in length).  
 MTBE = Methyl-tert-Butyl Ether  
 DIPE = Diisopropyl Ether  
 ETBE = Ethyl-Tert-Butyl Ether  
 TAME = Tert-amyyl Methyl Ether  
 TBA = Tert-butyl alcohol  
 1,2-DCA = 1,2-dichloroethane  
 TOG = Total Oil and Grease  
 TPH-D = Diesel  
 a = Quantity of unknown hydrocarbon(s) in sample based on diesel.

Attached is our report for your samples received on 02/08/2005 13:48

This report has been reviewed and approved for release. Reproduction of this report is permitted only in its entirety.

Please note that any unused portion of the samples will be discarded after 03/25/2005 unless you have requested otherwise.

We appreciate the opportunity to be of service to you. If you have any questions, please call me at (925) 484-1919.

You can also contact me via email. My email address is: [dsharma@stl-inc.com](mailto:dsharma@stl-inc.com)

Sincerely,

Dimple Sharma  
Project Manager

### Legend and Notes

#### Analysis Flag

L2

Reporting limits were raised due to high level of analyte present in the sample.

#### Result Flag

M5

MS/MSD spike recoveries were below acceptance limits.  
See blank spike (LCS).

R1

Analyte RPD was out of QC limits.

S8

Surrogate recoveries lower than acceptance limits.

UNIFORM HAZARDOUS WASTE MANIFEST

1. Generator's US EPA ID No. CA10101027821781051  
Manifest Document No. 1051

2. Page 1 of 1

Information in the shaded areas is not required by Federal law.

3. Generator's Name and Mailing Address  
CONXCO PHILLIPS  
76 BROADWAY  
SACRAMENTO, CA 95818

4. Generator's Phone  
916 558-7633

A. State Manifest Document Number 24081051

B. State Generator's ID

C. State Transporter's ID (Reserved)

D. Transporter's Phone (510) 295-1393

5. Transporter 1 Company Name Ecology Control Industries

6. US EPA ID Number CAD982030173

7. Transporter 2 Company Name

8. US EPA ID Number

9. Designated Facility Name and Site Address  
Ecology Control Industries  
255 Fair Blvd  
Richmond, CA 94801

10. US EPA ID Number CAD009466392

11. State Facility ID 510-295-1393

11. US DOT Description (including Proper Shipping Name, Hazard Class, and ID Number)

12. Containers No. Type

13. Total Quantity

14. Unit Wt/Val

15. Hazardous Waste Number

Non-RCRA hazardous waste, solid (waste empty storage tank)

001 TP

12000 P

P

EXCISE TAX NONE

b.  
c.  
d.

16. Additional Description: EMPTY STORAGE TANKS  
TANKS HAVE BEEN FILLERED WITH SOLID WASTE BEING REMOVED FROM FACILITY

17. Handling Labels for this Consignment

15. Special Handling Instructions and Additional Information  
Wear proper protective equipment while handling. Weights or volumes are approximate.  
24 Hour emergency contact: Conxco Phillips 256424  
24 Hour emergency telephone number: 916-558-7633  
Site Address: # 5345 HARVEY ROAD FARMERS, CA 95828  
ECI JOB# S2-T7654436

16. GENERATOR'S CERTIFICATION: I hereby declare that the contents of this consignment are fully and accurately described above by proper shipping name and are classified, packed, marked, and labeled, and are in all respects in proper condition for transport by highway according to applicable international and national government regulations.  
If I am a large quantity generator, I certify that I have a program in place to reduce the volume and toxicity of waste generated to the degree I have determined to be economically practicable and that I have selected the practicable method of treatment, storage, or disposal currently available to me which minimizes the present and future threat to human health and the environment; OR, if I am a small quantity generator, I have made a good faith effort to minimize my waste generation and select the best waste management method that is available to me and that I can afford.
